VEMO

ELECTRONIC PARTS BY VIEROL

VEMO is the quality brand for high-quality electronic automotive replacement parts. With more than 15,000 VEMO replacement parts, we cover numerous models from European, American and Asian vehicle brands.

We are particularly proud of our range of sensors and switches:

VEMO offers more than 4,000 different replacement parts such as parking sensors, sensors for crankshafts and camshafts, air flow meters, steering column switches, thermal switches and much more.

Whether for sensors, switches, small engines, replacement parts for exhaust gas recirculation or products for vehicle inspections – VEMO offers the best quality. We are therefore the perfect alternative to the original part manufacturers.

We offer smart repair kits in the EXPERT KITS+ section – from practitioner to practitioner – thus also helping you to save time. The Q+ seal identifies replacement parts with OEM quality, just like those made by the original equipment manufacturers.

15 experts work every day to expand the range constantly, and to ensure continuous quality improvements for the VEMO products. Clients from numerous countries already trust us – time for you to get to know us too!

SENSOR TECHNOLOGY

The car's sensor technology has gained considerably in importance in recent years. Sensors in the car work in the background and support the car and the driver.

Vehicle sensors can detect and react to changing conditions inside and outside the vehicle. Whether it is the intelligent triggering of the airbag, the detection of temperature or the measurement of tyre pressure - the number of sensors in modern vehicles will increase significantly in the coming years.

The VEMO range includes rain sensors, light sensors, NOx, exhaust and pressure sensors as well as sensors for comfort and safety functions such as optical sensors and sensors for parking assistance. Each sensor is first and foremost an electronic component and therefore a wearing part. If they fail, car malfunctions are not long in coming. Replacing a sensor usually provides a quick remedy.

Explore the VEMO portfolio and find the right sensor for your application.

SENSOR, WHEEL SPEED + WHEEL BEARING SET + ABS SENSOR RING

SENSOR, WHEEL SPEED | 21502

Information

In cooperation with our Experts we constantly collect impulses from your business, the workshop. We transfer these results into optimal repair solutions called EXPERT KITS+.

The current kits contain a vehicle-specific wheel speed sensor and the corresponding wheel bearing kit or an alternative ABS-sensor ring. Not infrequently a defective sensor remains on the wheel bearing or ABS sensor ring itself.

Due to mechanical clearance, blooming corrosion or interruptions in the magnetic ring the air gap between individual components become too small. As a result damage to the wheel speed sensor is a common consequential error. To have this repair comfortable and cost-effective, we combined these products for your optimal repair procedure.

SYMPTOMS

- Indicator light comes on
- Uncontrolled regulating of driving safety systems
- Spinning wheels at varying road conditions
- Error set in ECU

REASONS OF FAILURE

- Mechanical damage due to defective wheel bearings
- Heavy soiling and corrosion as result of external influences
- Interruption in ABS sensor ring

RECOMMENDED BY THE EXPERTS

- Inspection of the single components
- Resistance measurement of passive wheel speed sensors
- Voltage or oscilloscope measurement of active wheel speed sensors

SENSORS, WHEEL SPEED, WHEEL BEARING KITS AND ABS SENSOR RINGS FROM VEMO

YOUR EXPERT FOR CLOCKSPRINGS

23909

Function

The clockspring is an important component in the vehicle for establishing a reliable and trouble-free electrical connection between the fixed steering column and the movable steering wheel. Initially developed to transmit the ignition pulse for the driver's airbag, today additional control signals for the horn and steering wheel remote control elements for

the radio, on-board computer, cruise control or driver assistance systems are transmitted via the clockspring.

As the sliding contacts used in older models were too unreliable and prone to faults (especially for the airbag ignition signal), clockspring technology was developed. A special conductive foil is located in a closed

housing and is designed in such a way that it can easily follow the rotary movement of the steering wheel in any direction without being damaged. There are also versions in which sliding contacts are combined with a clockspring. In this case, only the horn is activated via the sliding contact.

SYMPTOMS

- Failure of the steering wheel controls
- „Airbag“ warning message on the display
- Noises when operating the steering

REASONS OF FAILURE

- Breakage of the conductor track due to material fatigue
- Defect in the electrical contacts
- Demolition due to incorrect assembly

RECOMMENDED BY THE EXPERTS

- Switch off ignition
- Follow the vehicle manufacturer's instructions
- Before fitting, the steering wheel must be in the centre position and the wheels in the straight-ahead position
- During installation, make sure that the fixing of the clock spring is not damaged or removed
- Opened clock springs must not be reassembled and fitted. They must always be replaced

TECH-INFO

RAIN SENSORS IN OE QUALITY

23910

Function

It's too dark, cold and you got a lack of clear vision? Not with the driver assistance system, which automatically supports you in the beginning of your trip.

In case of rain, a transmitter and receiver diode in the sensor helps us. The transmitter diode emits an infrared light which is reflected by the windshield of the vehicle and directed to the receiver diode. When the windshield is dry, the light reaches the receiver completely. The more rain that falls, the less light reaches the receiver and the windshield wiper automatically gives you a clear view.

On the other hand, the light intensity increases or decreases (day, twilight or night), the sensor has additional diodes that measure the incidence of light and thus control the driving light.

If it is too hot or cold in the vehicle, temperature sensors are activated for the solar control on the windshield, which regulates the air conditioning system to the set comfort level. Same behaviour with the humidity measurement, which is carried out in the interior at the sensors, where the air conditioner is also activated to regulate if there is too much humidity.

For more information, please visit our VIEROL blog:

www.blog.vierol-shop.de/en/rain-and-light-sensors-from-vemo-clear-visibility-in-all-weathers/

SYMPTOMS

- Wiper without function
- Irregular wiping movements
- Faulty light control
- Warning messages in the on-board computer

REASONS FOR FAILURE

- Sensor/diodes defective
- External influences such as dirt, stone chips or cable breaks
- Calibration error

ADVANTAGES

- **Fast response:** Wipers and headlights automatically adapt to the weather conditions to provide the driver with optimum support.
- **Focus on the road:** Automated settings minimise distractions as the driver does not have to intervene manually.
- **Focus on the road:** Automated settings minimise distractions as the driver does not have to intervene manually.
- **Efficient use of energy:** The wiper intensity adapts to the rain and the headlights are only activated when required – this saves energy and extends the service life of the lighting.

- **OE quality:** Manufactured to strict OEM standards for maximum reliability and durability.
- **Realistic testing:** Tested under real weather and light conditions by VIEROL Academy experts.
- **High coverage:** Suitable for over 10,000 vehicle applications, VEMO offers a versatile and precise solution.

VEMO NOx SENSOR

NOx-SENSOR, UREA INJECTION | 13309

Information

NOx sensors are crucial for emission monitoring and compliance with legal limits. VEMO offers high-precision and durable sensors that are developed according to OE specifications. A NOx sensor, or nitrogen oxide sensor for short, is an electronic component that measures the concentration of nitrogen oxides (NOx) in the exhaust gas. These gases are mainly produced at high combustion temperatures and are harmful to the environment and health.

The measured data is forwarded to the SCR control unit and processed there. NOx sensors are widely used in modern vehicles for reliable monitoring and precise control of emissions. Highest quality is VEMO's top priority. Our NOx sensors comply with OE specifications and fulfil the demanding IATF 16949 quality standard of the automotive industry.

VEMO NOx sensors are tested on state-of-the-art test benches and in vehicles before delivery. This is the only way to ensure that the sensor works perfectly in everyday workshop use. A high-quality VEMO NOx sensor avoids problems and saves costs in the long term.

SYMPTOMS

- The engine indicator light comes on
- Increased fuel consumption
- Reduced engine power
- No regeneration of the storage catalyser
- Exhaust emission values are not met
- Fault memory entry in the control unit

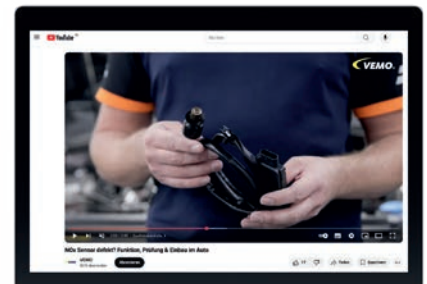

REASONS OF FAILURE

- Chemical ageing of the component
- Interrupted cable connections
- Pollution
- Thermal loads

RECOMMENDED BY THE EXPERTS

- Recording measured values using a suitable diagnostic device
- Visual inspection of the components
- Sensor initialisation after repair

SENSORS, CRANK/CAMSHAFTS

SENSORS | 11604

FUNCTION

The camshaft sensor determines the exact position of the crankschaft mechanism and reports it to the engine control unit. The ignition and injection times can therefore be calculated. This information is required for functions such as initiating injection on sequential injection engines, the trigger signal for the magnet valve on pump valve injection systems and for cylinder-specific knock control.

The camshaft sensor works according to the Hall effect and reads the camshaft sprocket. As the ring gear rotates, the sensor head registers the changing Hall voltage and sends it as well as the position of the camshaft to the control unit.

SYMPTOMS

- Engine control unit operates in the emergency operation, at worst engine stall
- Engine control symbol lights up
- An error code is saved
- Increased fuel consumption

CAUSES OF FAILURE

- Breakage or mechanical damage to the encoder wheel
- Contacting problems
- Temperature problems
- Internal short circuits
- Line short circuits

ATTENTION

- The permissible tightening torque is max. 10Nm.
- The sensor is mounted by pushing it in (no slamming).
- There must be no forces acting on the plug or the ribs when using mechanical mounting aids.

SENSOR, ADAPTIVE CRUISE CONTROL

ADVANTAGES OF ADAPTIVE CRUISE CONTROL

Safety: ACC helps to prevent rear-end collisions by automatically reducing speed when the vehicle in front slows down.

Comfort: Drivers can relax on longer journeys as the system automatically controls and adjusts the speed.

Efficiency: By adapting the speed to the traffic, ACC can help to optimise fuel consumption.

SENSOR, XENON LIGHT – HEADLIGHT RANGE ADJUSTMENT

SENSORS | 10103

Function

A basic distinction is made between manual and automatic headlight range adjustment.

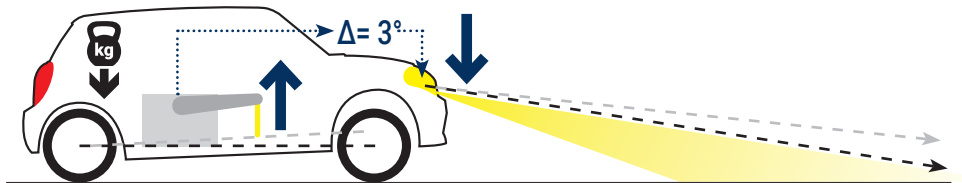

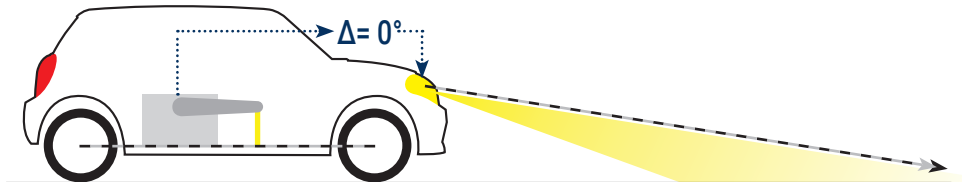

In manual LWR, the control is done by the driver himself.

Automatic LWR is divided into dynamic and quasistatic. The dynamic LWR is mainly installed in vehicles equipped with xenon headlights. This reacts to the different loading conditions in the vehicle as well as to changes in inclination caused by driving, such as acceleration and braking.

In the quasi-static LWR system, a control unit evaluates the data from the front and rear axle sensors, compares these with the stored target data and, if necessary, controls the servomotors on the headlights accordingly.

Advantages of automatic and quasi-static headlight range adjustment:

- Better road illumination
- less or no glare from oncoming traffic
- independent automatic headlight range adjustment

REASONS FOR FAILURE

- Servomotors on the headlights defective
- LWR sensor for the vehicle level defective
- Control unit has been replaced and not coded
- Headlights have not been adjusted (default setting)
- Control unit defective
- Interrupted data line
- No supply voltage
- Mechanical damage

RECOMMENDED BY THE EXPERTS

- Annual inspection of all components belonging to LWR
- With manual LWR, regularly actuate the adjuster with the lighting switched on
- When replacing a light fitting, always check whether it has been installed correctly

SENSOR, XENON LIGHT (HEADLIGHT RANGE ADJUSTMENT)

You can find the entire range at www.vierol-shop.de

- **extensive range:** for the latest applications worldwide
- **iSP film:** securely packed in iSP antistatic packaging film
- **tested quality:** many sensors in Q+ quality
